

Testing the Fluorescence Advantage: Solar-Induced Fluorescence as an Early Indicator of Agricultural Drought Stress in Marathwada, Maharashtra

Sakshi D. Maske

Highlights

- SIF's decline came before NDVI's in 7 of 8 growing seasons studied.
- Drought years did not show a bigger SIF-NDVI lag than normal years.
- A cross-correlation check found NDVI leading SIF in 3 of 8 years.
- SIF-rainfall correlation held up, but weaker than an earlier estimate.
- Satellite signals beat the 2018 official drought declaration by 7-8 weeks.
